

Enable search and filtering

Filters

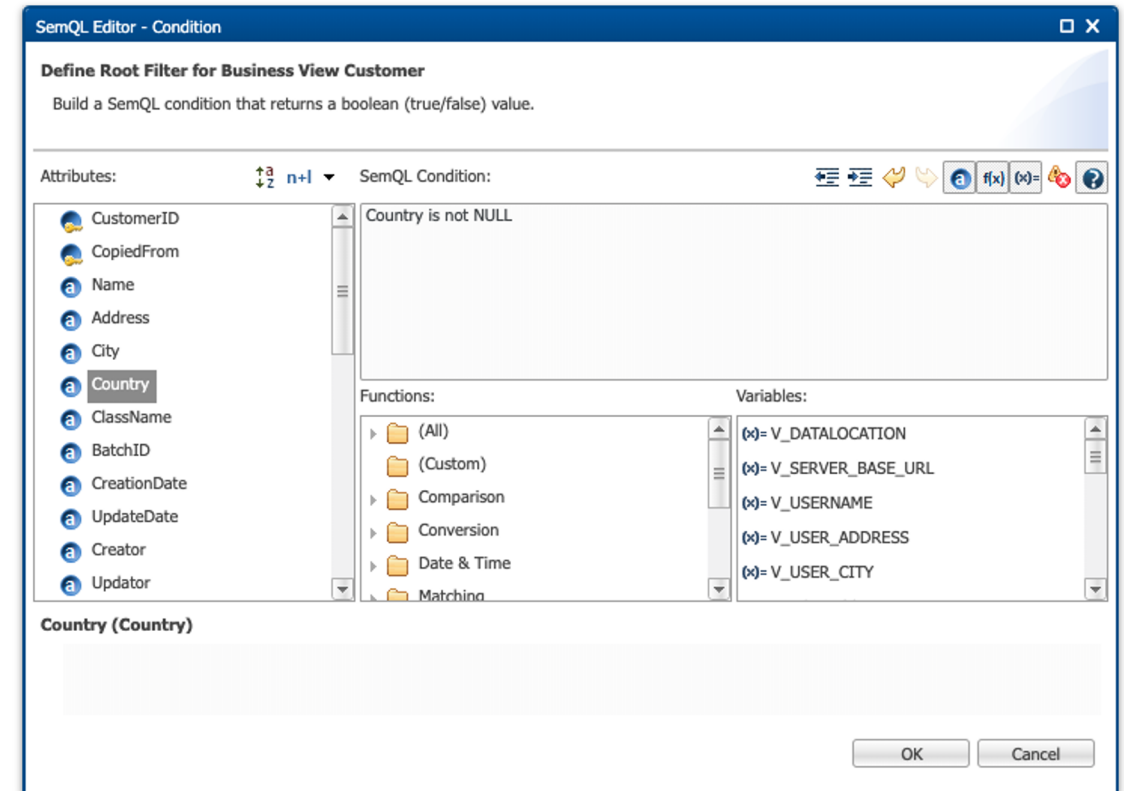

Filters

Use SemQL expression to display/retrieve only subset of records.

Records that do not meet the condition are excluded.

Invisible to end-users and they can't modify or disable it.

Filters are used everywhere

- Business views
- Steppers
- Enrichers
- Collections & Embedded collections
- Search forms
- Charts
- Dashboards
- Model variables
- Duplicate managers
- Privileges
- REST API

Enable search and filtering

Search forms

What are search forms?

- Filter data in the business views, available in the right sidebar
- Can be combined, saved and shared between users.
- 4 default filters:
 - **Full text:** Search all attributes of an entity that are marked as searchable
 - **Form:** Provide value pickers for each searchable attributes
 - **Advanced:** Specify which attributes to search and the operators to use
 - **SemQL:** for power users, use SemQL expression

The screenshot displays the 'Customer' entity view in the Semarchy Intelligent Data Hub. The main table shows one filtered customer record: 'Total corp' with ID 1, located at '12 rue du lac' in 'Paris', 'France'. The right sidebar contains a search form titled 'Customer (1 - Filtered)'. The form has a 'NEW FILTER' button and a 'FILTERS (0)' indicator. The search type is set to 'Advanced'. The form includes a text input field with the value 'Total' and a dropdown menu showing 'Name CONTAINS'. Below this, there is a section for combining filters with the text 'AND Country IS NOT NULL'. The form also includes 'RESET', 'APPLY', and 'X' buttons at the top right.

Customer	Customer ID	Name	Address	City	Country
Total corp	1	Total corp	12 rue du lac	Paris	France

Custom Search Forms

Additional filters can be defined **for each entity**

- Define search **parameters**
- Use search parameters to build a **SemQL query**
- Exposed in the **Business View**
 - Filters
 - Can enable/disable search types for each business view

Business View configuration
