

Designing authoring steppers

# Steppers

Demo

## **Steppers in action**

# What are steppers ?

Defines a **guided authoring** experience:

- Creating, editing, importing one or more records
- E.g. **CreateContact stepper** guides a user authoring contacts:
  - They will author **Contacts** and their attached **Addresses**
    - Step 1: Contact Info
    - Step 2: Addresses

Contains two types of steps:

- **Collection Step:** To select one or more records and edit these records.
- **Form Step:** Displays attributes of one record using the layout defined in a form section or tab.

Multiple form steps can be sequenced to guide users through creating or modifying a record.

The screenshot displays the 'Author People' form in Semarchy XDM. The form is titled 'Author People' and features a green header bar. Below the header, there is a red circle with a white 'W' and the text 'William Smith'. To the right of this, it says 'People Creating'. A progress bar at the top indicates five steps: 1. Basic Info (active), 2. Name Enrichment, 3. Address Enrichment, 4. Email Enrichment, and 5. Phone Enrichment. The form fields are organized into two columns. The left column contains 'ID' (20141), 'Given Name' (William), and 'Family Name' (Smith). The right column contains a 'Notes' section with the text: 'This is the minimum set of information that we allow when creating a new user. The subsequent steps give explicit insight into how Semarchy xDM can enrich this data.'

# Configuring triggers

In a stepper, it is possible to automate data changes using triggers and enrichers.

- **Stepper triggers**

- Execute database procedure calls when the stepper starts or finishes. Applies to the entire data set.

- **Step triggers**

- execute enrichers or database procedure calls when the user enters, leaves or performs certain operations in the step. Applies to just one record
- E.g.: Enrich an address from GoogleMaps after a user enters each new address

- **Form step enrichers**

- Run enrichers when the user opens a form step or modifies data in this form step.

# Configuring validation

In a stepper, it is possible to run data validations and raise issues to the user.

- **Stepper validation**

- Check data in any entity modified in the stepper in order to warn or block the user. They run **when the stepper finishes**. Applies to the whole selection of records inside the stepper.

- **Step validation**

- Check data in the entity modified in the step in order to warn or block the user. They run **when the step completes**. Applies to each record one-by-one.

- **Form validation**

- Check data in the entity modified in the step in order to warn or block the user. They run **when the user opens or modifies data in the form step**.

# Configuring reference management

If a form step contains **reference fields**, then it is possible to configure the **selection of these references**.

Uses one of the following components:

- **An autocomplete field:** Lists selectable records filtered by a search expression as you type in.
- **A reference selection dialog:** Shows a collection of selectable records.

# Configuring many to many creation

For stepper collections pointing to entity representing a **many to many relationship**.

Allows to **select the record at the other side** of the relationship instead of **creating the double reference** in the many to many entity.

More logical for an end-user.

The screenshot displays the 'Collection Step: Owners' configuration window. The 'Many to Many Relation' checkbox is checked, and the 'Target Foreign Attribute' is set to 'Customer'. The 'Create Product' button is visible. A 'Select Customers' dialog is open, showing a table of filtered customers.
