

Deleting Records

- **Conditions**

Under what circumstances/privileges am I allowed to delete a record?

- **Propagation**

What do I do with other records that reference the record I am about to delete ?

- **Retention**

Should I physically remove the data of the deleted record or am I allowed to keep it in a separate table?

- **Integration**

Is my record used in other systems? Should I push the ID of the deleted record to those systems?

Deletion

- Enabled for each entity
- References define how deletions propagate to child records:
 - **Cascade** and delete the children
 - **Restrict** the deletion if a child exists
 - **Nullify** the reference to the deleted parent
- Each Delete action is configured to perform a:
 - **Hard Delete**: Physical deletion, no recovery possible
 - **Soft Delete**: Logical removal

Delete always keeps track of the deleted records (the Master ID) so that they do not reappear later.

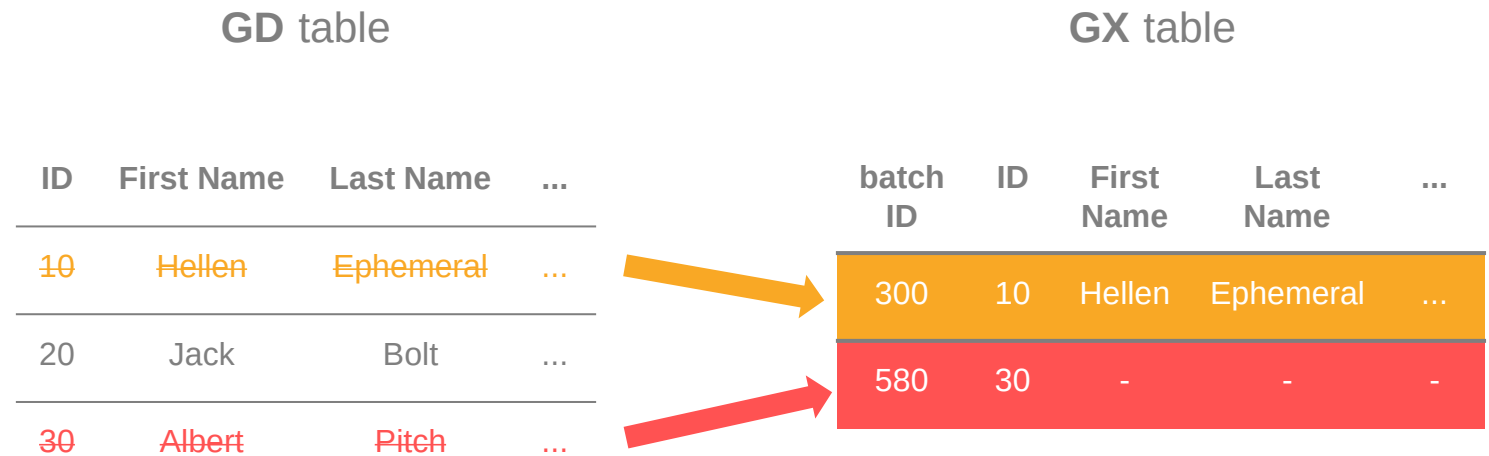

Hard Delete vs Soft Delete

Soft Delete

Will remove records from the GD table and **move** them, **with their data** to GX table

Hard Delete

Will remove records from the GD table and **only move their ID** to the GX table.
Data is permanently removed

Load data in SA table to manage delete

- You can load data in SA table in order to manage deletes
 - The integration process will manage the delete as configured in the model
 - Restrict
 - Nullify
 - Cascade
- You have to load the following columns :
 - **B_LOADID**
 - ID of the row to be deleted
 - B_DELETETYPE (SOFT_DELETED or HARD_DELETED)
 - B_DELETEDATE
 - **B_DELETEAUTHOR**
 - B_DELETEOPERATION : An ID that represent the delete operation (GUID or LOADID as an example)

Deletion process

Propagate through cascade

Extends the deletion to the child records directly or indirectly related to the deleted ones, if configured.

Propagate through nullify

Nullifies child records related to the deleted ones, if configured.

Compute restrictions

Removes from deletion the records having related child records and a Restrict configuration for the Delete Propagation. If restrictions are found, the entire delete is canceled as a whole.

Propagate to owned master record

Propagate deletion to the master records attached to deleted golden records. This step only applies to ID and fuzzy matched entities.

Publish deletion

Tracks record deletion, with the record values for soft deletes only, and then removes the records from the golden and master data.
