

Lab 5 - Survivorship

Lab 5

Create survivorship rules to determine how the Golden Record will be constructed from the best data from the master Records.

Task 1: Create a survivorship rule

1. Create a new **survivorship rule** to the *Customer* entity for the *CustomerName*.
2. Add *CustomerName* to the **Attributes**.
3. In the **Consolidation Rule**, set the **Consolidation Strategy** to *Most Frequent Value*.
4. Set the **Override Rule** so that changes by the users are allowed and take precedence over the source systems: *Override - until next user change*.

Task 2: Update the default survivorship rule

1. We must remember to change the **DefaultRule** from Custom Ranking to use a **Preferred Publishers** consolidation strategy, in this order:
 - DataEntry-MDM
 - Salesforce-CRM
 - Marketo-MKT
 - NetSuite-ERP
2. In case of a tie, use the latest record.
Hint: Use UpdateDate DESC (descending) as the ranking expression UpdateDate DESC.
3. Set the **Override Rule** such that updated data from Publishers will overwrite any user changes.

Task 3: Create a field specific survivorship rule

Define another **Survivorship rule** for *TotalRevenue* which will take the **Largest Value** but not allow the users to edit the value in the application.

Hint: Override Strategy –‘No Override’
