

xDM Developer Training

Intelligent Data Hub Overview

Training content

- **Introduction**
 - **The intelligent data hub**
- Modeling and integration
- Application design - Browsing
- Application design - Authoring & Stewardship
- The Hub
- Analytics
- Administration

What is master data ?

- Holds the core **entities** of your enterprise
- Products, customers, suppliers, places, things, people, organizations, third parties, parts, etc
- Needs to be:
 - Comprehensive
 - Accurate
 - Unique
 - Consistent
- **Operational** or **Analytical** use cases

Why does the business care about MDM?

Bad data is here!

Eliminate bad data across BI, EPM,
DW, ERP platforms

Deliver a uniform process across on-
premises, cloud or hybrid
architectures

Need governance

Empower business users,
but keep it simple, enforce
quality and accountability

Reduce risk!

Touch everything

Support any domain (customer,
product, vendor, location, etc.) with a
common platform & experience.

User-friendly interface for better
decision-making

Deliver master data via direct
integration, API, web services

Master Data Management

- **People, processes and tools** to manage Master Data
- MDM projects involve:
 - Assessing existing data sets with **profiling**
 - Modeling business **entities** corresponding to the master data
 - Designing **validation, enrichment, matching** and **survivorship** rules to certify master data and produce golden data
 - **Applications** for business users and data stewards to browse and manage the data
 - **Integration** processes to publish master data into the hub and consume golden data
 - Creating **dashboards** to monitor the project efficiency

Key concepts

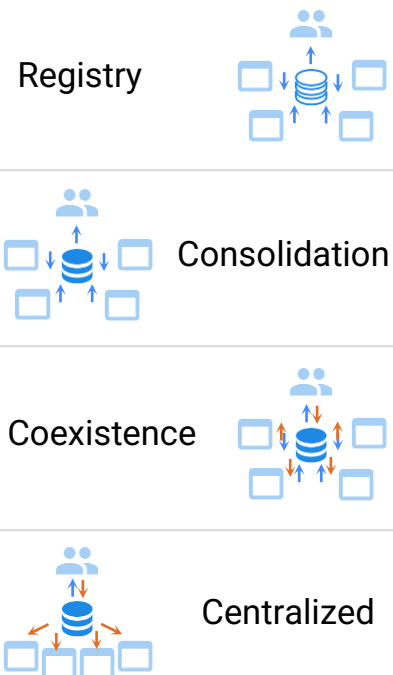

- **Master data:** Core entities of your enterprise (customers, products, etc), stored in source systems across the enterprise. This master is pushed into the MDM Hub and certified to produce Golden Data.
- **Golden data:** This is the data produced and maintained by the MDM system. It is the “single source of truth”, consumed by downstream systems. Golden data is certified by applying enrichment, validation and match/merge rules to the master data contained in the source systems.
- **Enrichment:** The process that transforms, augments and standardizes master data in order to automatically fix this data to meet data quality standard.
- **Data quality validation:** The process that enforces data quality rules on master data, including completeness, integrity, validity, etc.
- **Matching:** The process that identifies similar master records (known as *duplicates*).
- **Survivorship:** The process that merges duplicates into a single golden record. The master records values are consolidated into that golden record.

xDM is multi-vector

Domains

-  Customer B2B
-  Customer B2C
-  Product
-  Location
-  Reference Data
-  Organization
-  Supplier
-  Financial

Styles

Use cases

Analytical

Operational

Organizations

-  Sales
-  HR
-  Marketing
-  Supply Chain
-  IT
-  Data Governance
-  Executives
-  Finance

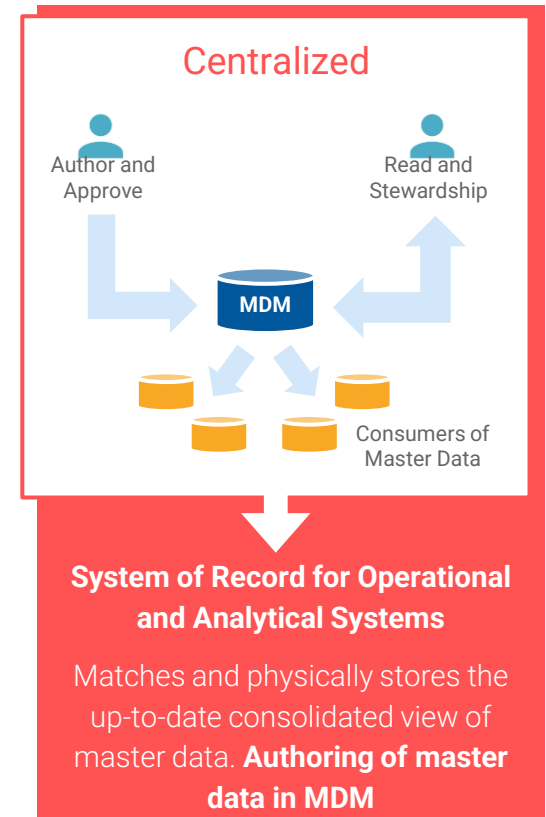

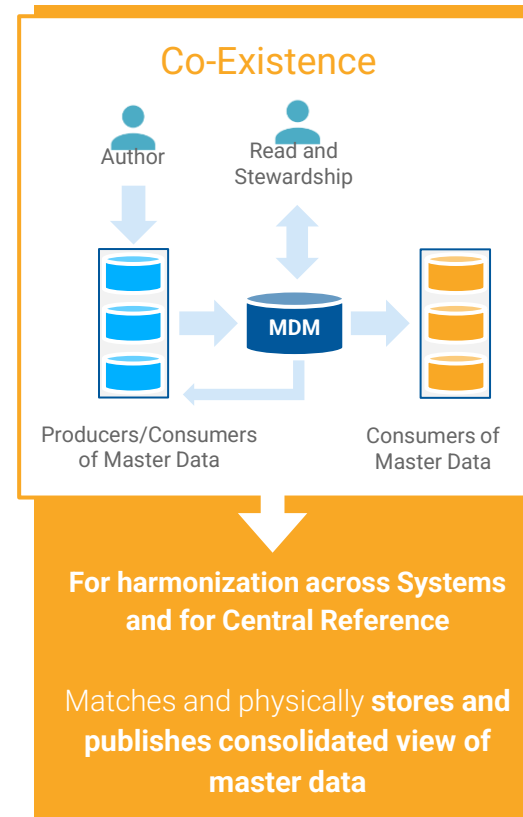

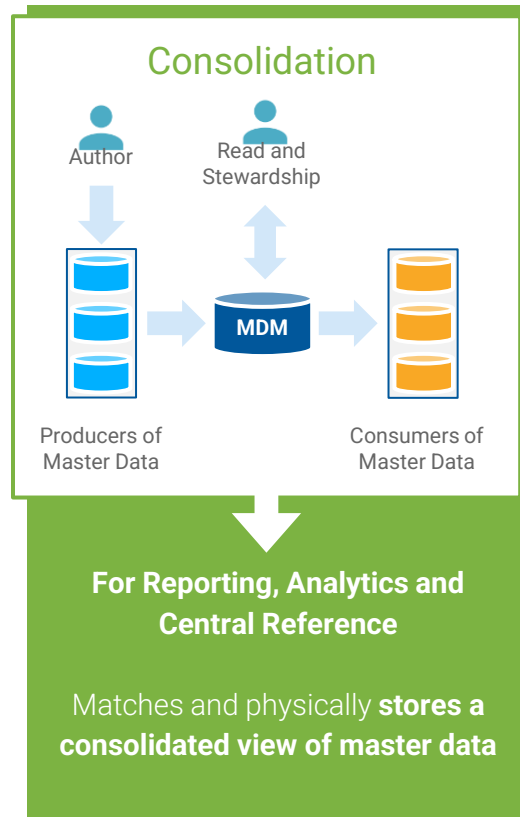

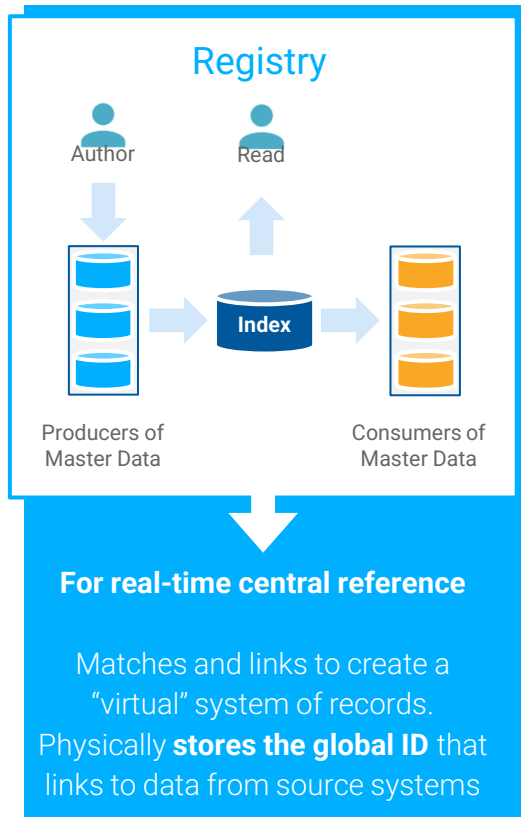

Industries

-  Retail
-  Finance
-  Insurance
-  Healthcare
-  Energy
-  Govt & Public
-  High Tech
-  Telco

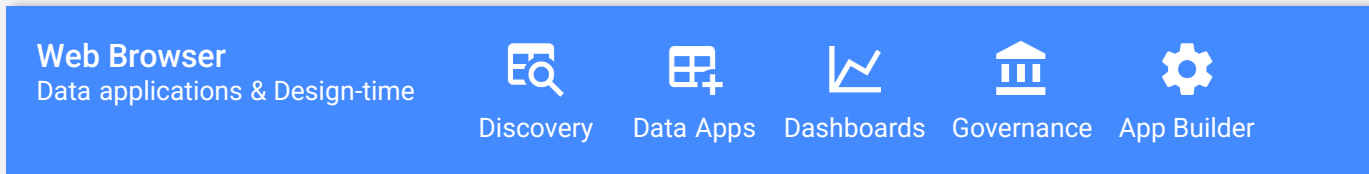

All in **ONE** platform

MDM architectures

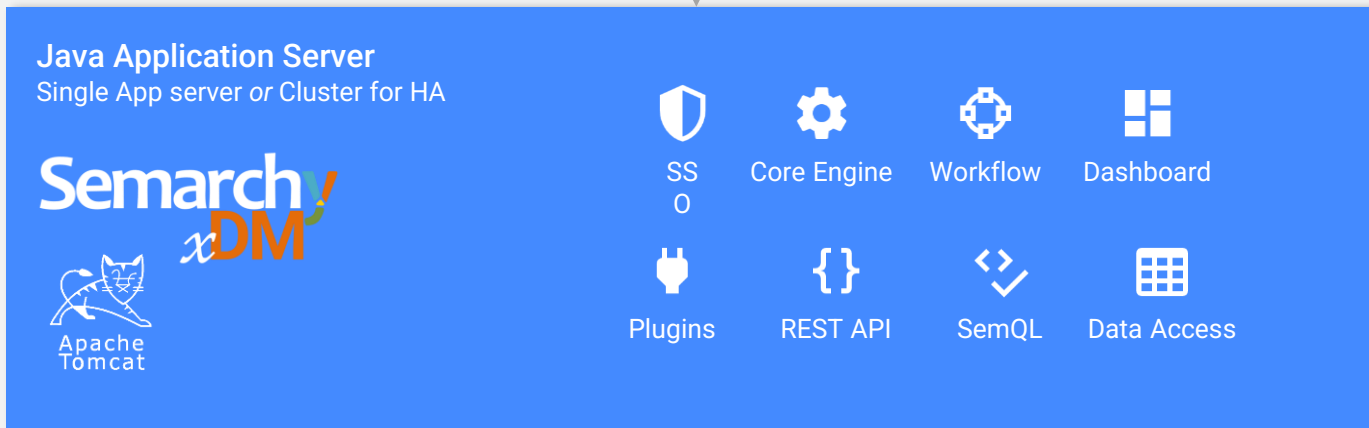

Four most common implementations for MDM

Architects Champions Business

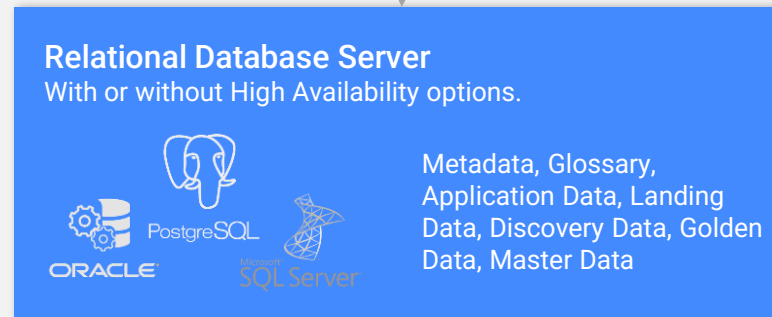

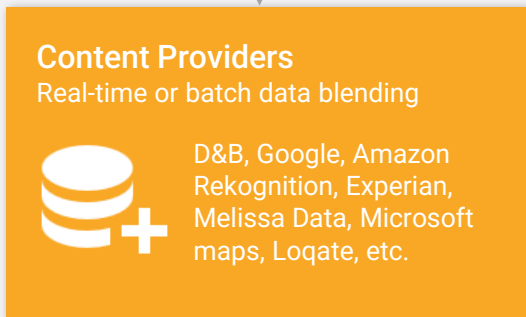

HTTPs

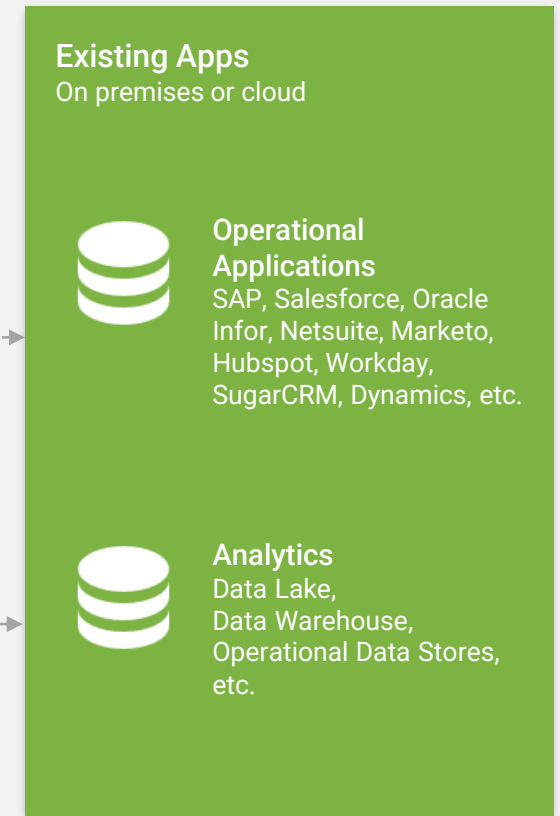

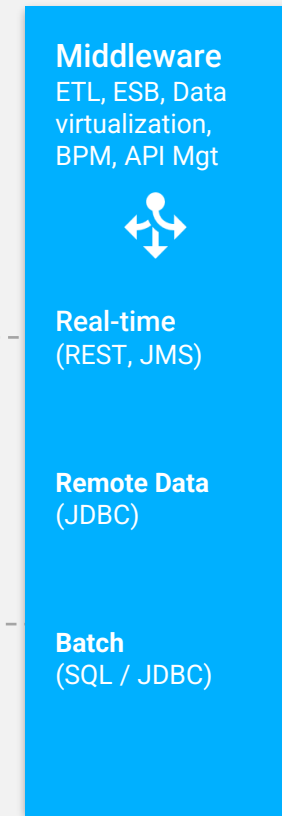

Enrichment
Plugin API

JDBC

On-Premises or Cloud Architecture
Simple, Robust, Scalable

Application Builder

- You design a Logical Model
 - **Entities & Relationships, Rules** and **Applications** component
- xDM generates a Data Hub including:
 - **Data structures**
 - **Certification processes**
 - **Applications** for users to:
 - Browse and author data
 - Exercise data stewardship
 - **REST API and SQL Interfaces** to publish and consume data
